A software that I regularly use that I personally find well designed is the IOS operating system on my Apple iPhone. A well designed software is something that effectively serves it's purpose to it's intended user. Me, being the intended user of IOS I find that it performs extremely well in any task I must use it for. An important aspect of a well designed software is stability and performance. There are very few cases where I have experienced any kind of crashing or instability while using my iPhone and I believe that this is due to IOS being a very well designed software. It takes a lot of skill and attention to detail to develop a software especially an operating system with such a high level of stability. IOS is used by millions of people around the world which is why Software Design is an extremely important aspect and developers must ensure that it be designed in a way where it can effectively serve it's purpose effectively, be stable and remain reliable. This is why I believe Apple's IOS operating system for the iPhone to be an amazing example of well designed software.
