During the requirements gathering stage of software development it is important for developers to interview and ask questions with the customers who are going to be using the software. Developers need to gather a list of requirements and features that the software will have. This ensures that the customers are happy with the product they receive and that the software is able to satisfy all of the needs of the user. This is an important step of the software development process that must be completed prior to beginning development. With a complete list of requirements the developers can then begin the development process with a complete understanding of the design of the software.

As a iPhone user, I want a bug free experience, so that I may have the confidence to rely on my device without worry of bugs or issues.

As a iPhone user, I want to be able to call and text people easily, so that I may be able to remain connected with friends and family at all times.

As a iPhone user, I want a safe and secure experience, so that I may feel comfortable that my data is safe and not being sold to advertisers.

As a iPhone user, I want a intuitive easy to use user interface with accessibility features, so that the software is accessible to anyone.

As a iPhone user, I want a long lasting battery, so that I can be able to use my device all throughout the day.
